AIM Flow BETA

REPOSITORY-AWARE DEVELOPMENT

Agentic work. Grounded in your repo.

Start with the project. Scope the task. Check the result. AIM Flow brings these steps together in a focused beta for agentic development.

Discover	Scope	Check	Evidence

ILLUSTRATED WORKFLOW

THE CURRENT BETA

Project-aware discovery

Inspect repository signals without changing the project. Propose a project-specific configuration.

Scoped task intake

Bind a prepared task to its project. Preview intake before a separately approved model dispatch.

A bounded source-check path

Explicitly selected npm source checks, verified in an isolated test environment. A reviewed npm/Vite offline build is qualified for one pilot environment.

A FOCUSED BETA. A BROADER DIRECTION.

Broader build and test chains and autonomous delivery are development directions. This beta does not establish arbitrary-project delivery, complete browser/test qualification or multi-user governance. A passed source check is not product acceptance.

Bring a repo. Define one useful next step.
